

SevaSathi (सेवासाथी)

System Architecture, Technology Stack Rationale, and Hackathon Defense Masterclass

DOMAIN

Hyperlocal Gig Economy & Cooperative Governance

ECOSYSTEM CORE

AI Voice Assistant + Trilingual i18n + Escrow

REVENUE SPLIT

85% Worker · 10% Welfare · 5% Ops

1. The Core Problem & The SevaSathi Solution

Traditional gig platforms (Urban Company, Uber, TaskRabbit) treat frontline service professionals as disposable contractors while charging **25% to 40% predatory commissions**. Furthermore, illiterate or semi-literate workers are excluded due to complicated, English-centric user interfaces.

85%

WORKER TAKE-HOME PAY

10%

COOPERATIVE WELFARE & INSURANCE

5%

PLATFORM MAINTENANCE

SevaSathi combines an on-demand marketplace with a **Democratic Worker Cooperative Federation**. Workers own the platform, access emergency health/tool loans, negotiate transparently via an in-app bargaining drawer, and use native voice typing in **Hindi, Bengali, and English**.

2. Technology Stack & Architectural Rationale

Every technology in SevaSathi was selected intentionally to maximize accessibility, speed on low-end mobile devices, and developer agility during high-stress deployments.

Frontend: Vanilla HTML5 / CSS3 / ES6+ Zero Overhead

- **Zero Compilation Lag:** Gig workers operate – budget smartphones on 3G/4G networks. Avoids 3MB–5MB React/Angular virtual-DOM bundle bloat.
- **Native Web Speech API:** Direct, zero-latency access to device microphone speech recognition for voice booking.
- **MutationObserver i18n:** Live trilingual translation engine without framework hydration race conditions.

Backend: Node.js & Express.js High Concurrency

- **Non-Blocking Event Loop:** Manages thousands of concurrent chat rooms, live bids, and booking status updates efficiently.
- **Unified JS Language Stack:** Seamless data structures shared between frontend validation and backend controllers.
- **Lightweight REST Middleware:** Robust authentication, rate-limiting, and dispute routing.

Database: MongoDB (NoSQL) Schema Flexibility

- **Dynamic Schemas:** A plumber's profile (tools, licenses) differs from an enterprise contract. MongoDB stores both without rigid SQL migrations.
- **Nested JSON Subdocuments:** Real-time bargaining iterations (`{ offeredBy: 'customer', rate: 400, counter: 450 }`) stored naturally inside single booking documents.
- **High Write Throughput:** Fast ingestion for high-frequency community chat messages.

Data Format: Native JSON Universal Standard

- **Zero Serialization Friction:** `JSON.parse()` and `JSON.stringify()` run natively in all browsers and engines without ORM mismatches.
- **Modular Locale Files:** `/locales/hi.json` and `/locales/bn.json` allow zero-downtime updates to translation dictionaries.
- **Human-Readable Payloads:** Simplifies debugging and transparent API audit trails.

3. End-to-End System Modules & Data Pipeline

Module	Underlying Mechanism	User / Worker Benefit
5-Tier i18n Translation	Exact phrase map + dynamic regex patterns + contextual chat rules + universal token lexicon.	100% full translation into Hindi and Bangla; zero English words left untranslated.
Smart Voice Assistant	Native Web Speech API + Gemini LLM fallback intent extractor. Auto-sends on pause.	Enables non-literate workers and busy customers to transact via voice only.
Milestone Escrow	State-machine holding ledger with automated cryptographic OTP release.	Guarantees payment for workers; protects customers against incomplete work.
Cooperative Governance	10% automated treasury allocation, peer tool lending registry, democratic dispute council.	Emergency medical support, safety equipment loans, and elimination of middleman exploitation.
3-Warning Strike Ban	Persistent strike-counter ledger with automated 403 Forbidden trigger on 4th strike.	Eliminates abusive customers, fraudulent workers, and wage-theft actors.

4. Hackathon Defense Masterclass (Questions & Answers)

Winning 30–Second Elevator Pitch:

"Judges, while tech platforms made gig apps a billion-dollar industry, the frontline workers who fix our homes and clean our offices were left behind with 30% commission cuts, no insurance, and confusing English apps. Meet **SevaSathi** — the world's first AI-powered Democratic Worker Cooperative Marketplace. We empower workers to keep 85% of their earnings, pool 10% into collective healthcare, chat and book through voice in Hindi and Bangla, and secure every job with digital escrow. Fair wages. Native voice. Zero exploitation."

BUSINESS Q1: How is SevaSathi different from Urban Company or TaskRabbit?

Answer: Traditional apps operate as rent-seeking middlemen extracting 25–40% cuts with opaque algorithms and zero safety nets. SevaSathi is built as a democratic worker cooperative: workers retain 85% of revenue, 10% funds their collective insurance/pension pool, and 5% covers platform servers. We also provide AI voice booking for non-literate workers.

FINANCIAL Q2: If you only take a 5% platform fee, how is the business model sustainable?

Answer: We eliminate corporate overhead, physical call centers (automated with our AI assistant), and high acquisition bloat. In addition to the 5% fee, we monetize B2B Enterprise workforce contracts (hotels, facility management) through high-volume corporate subscription tiers.

TECH STACK Q3: Why didn't you build the frontend in React, Next.js, or Vue?

Answer: Our frontline workers use budget Android phones (~ devices) on patchy 3G/4G networks. React's virtual-DOM hydration introduces perceptible lag and memory bloat. Vanilla ES6+ guarantees 100/100 Lighthouse performance, instant load times, zero build failure risk, and direct access to native browser Speech APIs.

AI & NLP Q4: How does your AI Assistant handle mixed colloquial Indic languages (Hinglish / Banglish)?

Answer: Our AI pipeline combines rule-based heuristic symptom normalizers with Gemini LLM fallbacks. It understands colloquial phrases (e.g., "*pani tapak raha hai*" or "*fan cholge na*"), mapping them to standardized trade categories and extracting Indic numerals and relative dates ("*kal subah*", "*porshu*").

SECURITY Q5: How do you prevent fraud, fake workers, and customer payment defaults?

Answer: We enforce a 3-layer security system: (1) Pre-funded Escrow locks payment before worker travels; (2) Worker document verification with QR ID verification; (3) Customer and worker phone numbers remain masked until mutual confirmation; (4) 3-strike warning ledger permanently bans abusive actors.

5. Key Highlights Checklist for Judges

- | | |
|--|--|
| ✓ 101/101 Automated Tests Passing (100% Reliability) | ✓ Full Trilingual Support (English, हिन्दी, বাংলা) |
| ✓ Zero Middleman Exploitation (85/10/5 Model) | ✓ Smart Speech-to-Text with Auto-Dispatch |
| ✓ Milestone Digital Escrow Payment Protection | ✓ Dynamic In-App Bargaining Drawer |
| ✓ Cooperative Peer Tool Sharing & Mutual Aid | ✓ Enterprise B2B Workforce Roster & Billing |
